

Bovine TNF- α ELISA Reagent Set

GWB-F0F1X9

www.genwaybio.com

FOR RESEARCH USE ONLY

Technical Notes:	This kit is for the quantitative measurement of Bovine TNF- α in cell culture supernatants. If assaying other sample types, an appropriate Sample and Standard Diluent will need to be developed and validated. Any changes to the ELISA protocol may significantly affect the results generated and will require optimization.	
Included Components:	Description	Quantity
	Bovine TNF- α Coated Plate	2 each
	Bovine TNF- α Standard	2 each
	Bovine TNF- α Detection Antibody	2 each
	Streptavidin-HRP	1 each
	Plate Sealer	6 each
Additional Reagents Required:	Reagent	Formulation
	DPBS	0.008M sodium phosphate, 0.002M potassium phosphate, 0.14M sodium chloride, 0.01M potassium chloride, pH 7.4
	Reagent Diluent	4% BSA in DPBS, 0.2 μ m filtered
	Standard and Sample Diluent	Complete cell culture medium used to generate cell culture supernatant samples It is critical that this medium contain at least 1% carrier protein. If the medium does not contain carrier protein, use Reagent Diluent to dilute the Standard and samples.
	Wash Buffer	0.05% Tween [®] -20 in DPBS
	Substrate	3,3',5,5'-tetramethylbenzidine (TMB) Substrate <i>ELISA Accessory Pack: Catalog # GWB-374D5C</i>
	Stop Solution	0.18 M Sulfuric Acid <i>ELISA Accessory Pack: Catalog # GWB-2009AD</i>
Component Preparation:	Component	Preparation
	Bovine TNF- α Standard	Reconstitute Standard in 1 mL Standard and Sample Diluent. Dilute 250 μ L of the reconstituted standard in 250 μ L of Standard and Sample Diluent. The Standard now has a concentration of 7.2 ng/mL . Prepare 1:1 serial dilutions of the Standard by mixing 250 μ L Standard with 250 μ L Standard and Sample Diluent. Repeat 1:1 serial dilutions until reach a final concentration of 0.113 ng/mL. Use Standard and Sample Diluent as a zero standard.
	Bovine TNF- α Detection Antibody Working Solution	Dilute the 500 μ L of reconstituted Detection Antibody in 11.5 mL Reagent Diluent.
	Streptavidin-HRP Working	Dilute 500 μ L of Streptavidin-HRP in 11.5 mL Reagent Diluent.

	Solution											
ELISA Procedure:	<ol style="list-style-type: none"> 1. Prepare Standard and cell culture supernatant sample dilutions in Standard and Sample Diluent. 2. Add 100 uL of Standard or sample to appropriate wells. Note: Run each Standard or sample in duplicate. 3. Cover plate with Plate Sealer and incubate at room temperature (20-25C) for 1 hour. 4. Wash plate FOUR times with Wash Buffer. Note: Gently squeeze the long sides of plate frame before washing to ensure all strips remain securely in the frame. Empty plate contents. Use a squirt wash bottle to vigorously fill each well completely with 1X Wash Buffer, then empty plate contents. Repeat procedure three additional times for a total of FOUR washes. Blot plate onto paper towels or other absorbent material. 5. Add 100 uL of Detection Antibody Working Solution to each well. 6. Cover plate with Plate Sealer and incubate at room temperature for 1 hour. 7. Wash plate FOUR times with Wash Buffer as described in step 4. 8. Add 100 uL of Streptavidin-HPR Working Solution to each well. 9. Cover plate with Plate Sealer and incubate at room temperature for 30 minutes. 10. Wash plate FOUR times with Wash Buffer as described in step 4. 11. Add 100 uL of TMB Substrate Solution to each well. 12. Develop the plate in the dark at room temperature for 30-40 minutes. Note: Do NOT cover plate with Plate Sealer. 13. Stop reaction by adding 100 uL of Stop Solution to each well. 14. Measure absorbance on a plate reader at 450 nm. 											
Typical Standard Curve:		<p>Data represents a typical standard curve generated using the GenWay Bovine TNF-α ELISA Development Kit.</p> <p>A standard curve should be generated with each assay.</p>
